# Sustainability: the case of air transport

Flavio Porta

Università degli Studi of Bergamo

September 20, 2024

# Air Transport Contributes Relatively Little, Today...

## Global carbon dioxide emissions from aviation

Aviation emissions includes passenger air travel, freight and military operations. It does not include non-CO<sub>2</sub> climate forcings, or a multiplier for warming effects at altitude.

Our World  
in Data

OurWorldinData.org - Research and data to make progress against the world's largest problems.  
Source: Lee et al. (2020), The contribution of global aviation to anthropogenic climate forcing for 2000 to 2018, based on Sausen and Schumann (2000) & IEA.  
Share of global emissions calculated based on total CO<sub>2</sub> data from the Global Carbon Project. Licensed under CC-BY by the author Hannah Ritchie.

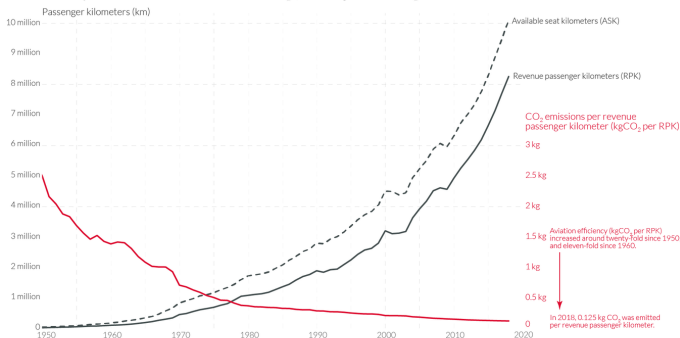

- Significant development possibilities, especially in Asia and Africa (Button, Porta, Scotti, *JTEP*, 2022 & Martini, Porta, Scotti, *JPA*, 2023)
  - Africa will double its population by 2050, reaching 2.5 billion. 1 in 4 inhabitants of the planet will be African (UN estimates, 2022).

# Technological Innovation Has Reduced Emissions

## Global airline traffic and aviation efficiency

Revenue passenger kilometers (RPK) measures the number of paying customers multiplied by the distance traveled. Available seat kilometers (ASK) measures the total number of seats available. The ratio between RPK and ASK measures the passenger load factor. Aviation efficiency data does not include non-CO<sub>2</sub> climate forcings, or a multiplier for warming effects at altitude.

- EU market liberalization allowed the growth of LCCs, which have reduced CO<sub>2</sub> emissions per ASK.
  - Liberalization in Europe has reduced CO<sub>2</sub> externality per passenger (Porta et al., *Transport Policy*, 2020).
  - Rate of fuel efficiency improvement  $\approx 2\%$

# The Impact of Air Transport

- Economic growth: Aviation is essential for global trade, representing over a third of world trade in value
- Employment: The aviation industry supports tens of millions of jobs worldwide
  - Campante, F., & Yanagizawa-Drott, D. (2018). Long-range growth: economic development in the global network of air links. *The Quarterly Journal of Economics*, 133(3), 1395-1458.
  - Brugnoli, A., Dal Bianco, A., Martini, G., & Scotti, D. (2018). The impact of air transportation on trade flows: A natural experiment on causality applied to Italy. *Transportation Research Part A: Policy and Practice*, 112, 95-107.

# The Economic Problem of Emissions: an example

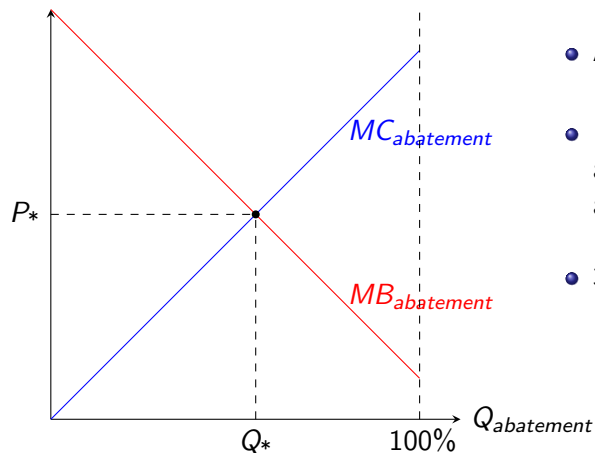

You are having dinner at a restaurant, imagine these scenarios:

- 1 you pay for your own food
- 2 at the end, the bill is split equally among all diners (now imagine that at this dinner are sit 8.1 billion people)

# The Economic Problem of Emissions: a modern approach

- A firm produces 2 products: 1) flights and 2) pollution abatement

$P_{abatement}$

- Abate pollution until  $MC = MB$
- $Q^*$  is the optimal amount of pollution abatement
- 3 possible strategies:
  - 1 Direct controls
  - 2 Taxation
  - 3 Cap and trade

# Who is gonna pay for additional costs?

- In air transport, the pass-through (the % of how much an increase or decrease in costs is passed on to consumers through the price) is very high (Bontemps, Martini & Porta, WP, 2023).
  - Any additional costs will largely end up in the prices of airline tickets, reducing the number of passengers, consumer welfare, and the profits of economic actors.
- Decrease in airlines' profits and in passengers' welfare

# Possible Solutions?

- Divide solutions into 2 different temporal horizons
  - Net zero emissions by 2050 (ICAO)
  - Very approximately: the 2050 fleet is the one ordered today
- Post-2050 horizon: fleets and infrastructure radically changed
  - Hydrogen engines as a possible long-term solution?

# Pre-2050 horizon: "unchanged" fleets and infrastructure

- More fuel efficient aircrafts
  - Retrofitting (e.g., winglets)
  - Decrease fleet age (e.g., cash for clunkers - Brueckner et al., 2024)
- SAF (Sustainable Aviation Fuel)
  - SAF has great potential, but their cost remains high
  - Possible risk of competition with food
- Replacement with high-speed trains (HSR)
  - The coexistence of air and HSR ensures greater competition
  - Building HSR infrastructure is very expensive and carbon intensive
    - HRS carbon break-even?
    - $\approx 20\%$  of long-haul flights emit  $\approx 80\%$  of CO<sub>2</sub>
- Offsetting
- Demand management solutions
- Non-carbon emissions (e.g., detailed weather forecasting with AI)
- Reducing inefficiencies

# One example of inefficiency

## Rerouting flights around Russia increases emissions

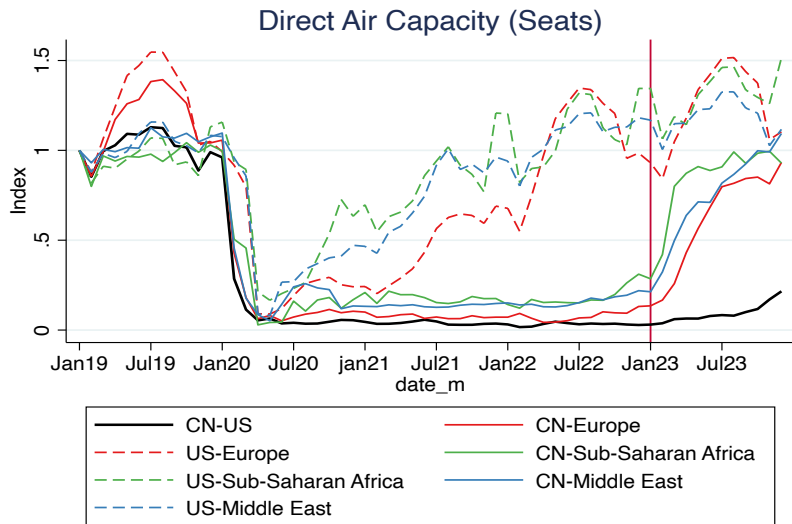

As flights are rerouting to avoid Russian airspace, flights are getting longer and emitting more greenhouse gas. Here's a look at four flights that have changed since the Russian invasion of Ukraine:

### Approximate increases in flight times and emissions

Route	Flight time increase	Fuel burn increase	CO <sub>2</sub> increase
 Tokyo to London	2 hours 26 minutes	5,684 gallons	54,566 kg
 Frankfurt to Tokyo	42 minutes	1,428 gallons	13,710 kg
 Seoul to Helsinki	4 hours 8 minutes	7,425 gallons	71,285 kg
 Helsinki to Tokyo	4 hours	7,186 gallons	68,985 kg

# China-US Post-Covid Air Connectivity

Source: OAG schedule analyser.

# China-US Post-Covid ticket prices

Average quarterly values					
Covid	Stops	Passengers	$\frac{PAX_{Post}}{PAX_{Pre}}$	Price*	$\frac{Price_{Post}}{Price_{Pre}}$
Pre	All	1,033,742		360	
Post	All	166,324	16%	1,295	360%
Pre	Direct	592,642		354	
Post	Direct	52,991	9%	1,519	429%
Pre	1	440,845		368	
Post	1	112,610	26%	1,191	323%
Pre	2	255		344	
Post	2	723	284%	1,196	348%

Pre-COVID: 2018 (Q1-Q2-Q3-Q4) and 2019 (Q1-Q2-Q3)

Post-COVID: 2023 (Q2-Q3)

\*Economy tickets in US\$ and exclude taxes, fees and fuel surcharges

- Pre-COVID:  $\approx 57\%$  of pax on direct flights (Post-COVID:  $\approx 16\%$ )
- If prices  $\uparrow$  & quantities  $\downarrow$ : **consistent with a supply shock**

- Market share for hub regions or countries in 2019 and 2023 for passengers China-US

gateway country/region	market share		difference
	2019	2023	
...	...	...	...
Middle East	0.27%	10.68%	10.41%
Western Europe	0.53%	13.52%	12.99%
Japan	2.42%	20.19%	17.77%
South Korea	4.33%	32.19%	27.85%

- Longer travel times implies also higher emissions *per passenger*

# Conclusions

- One of the most important challenges of this century is to reduce emissions without reducing mobility.
- Diffusion and economic convenience of new technologies.
- Promoting investments in the decarbonization of the aviation sector would also bring benefits in other sectors.
- Building an economic-legal context favorable to innovation, competition, diversification of supply, and sensitive to the well-being of consumers and the profit of economic actors.
- Infrastructure and fleets are unlikely to change significantly by 2050. In this context, SAF plays a major role, and increasing its use is essential.
